1 Academic Engine & Citation Pipeline

Academic writing requires verifiable claims backed by peer-reviewed literature. LaTeX isolates bibliographic metadata in `.bib` databases and relies on a multi-pass compilation sequence (`pdflatex` → `bibtex` → `pdflatex` → `pdflatex`) to build numerical citations.

Foundation model architectures and automated software agents require structured evaluation benchmarks [?]. Concurrently, reproducible research documentation demands strict separation of content from typography through compiled markup systems [?].

2 Work Package Breakdown

Project deliverables must be decomposed into explicit Work Packages (WPs). In Table ??, we summarize the primary delivery stages.

WP	Work Package	Main Tasks	Output	Weeks
WP1	Research & Ethics	Literature review; formal ethics application	Approved Ethics	1–4
WP2	Requirements	Requirements; system design	Architecture Doc	5–8
WP3	Core Implementation	Artefact sprints; GitHub commits	Working Artefact	9–16

Table 1: Initial Work Package plan for Final Year Project

3 Project Timeline Schedule

Visual scheduling in LaTeX is executed natively using the `pgfgantt` package, producing vector graphics that preserve typography and line weight without rasterization blur.
